Imisioluwa Faith Obaseki

imisioluwa@obaseki.dev | Portfolio | LinkedIn | GitHub | Nigeria (Remote)

SUMMARY

Smart contract engineer writing Solidity and Rust contracts that hold user funds, tested with Foundry unit, fuzz and invariant tests. I also build the TypeScript backends that talk to them, and I've deployed on Base, Monad and NEAR.

PROJECTS

Bulkhead - NEAR Hackathon, Smart Contract Engineer (team of 2)

- Wrote a Rust vault contract on NEAR that limits how much an AI agent can pay out. It controls Bitcoin and USDC on Base through NEAR Chain Signatures, so no person holds a private key.
- Enforced per-payout caps, cooldowns and round limits on-chain. Owner actions need a two-step proposal, and the contract can't be upgraded.
- Wrote 83 Rust unit tests and 15 TypeScript tests, and sent a Bitcoin testnet4 payout signed by the contract.

Chog Buddy - Chogathon 2026, Smart Contract and Backend Engineer (team of 2) | Live | GitHub Oct 2026

- Designed FocusPool, a staking contract where users stake ERC20 tokens on their own focus time. It reserves each bonus when the stake is placed, caps it at 1% of the pot and settles every bet exactly once.
- Wrote ChogSoul, which stores each NFT's daily activity by token ID so the record moves with the NFT when it's sold, and built the backend with wallet sign-in and NFT ownership checks.
- Ran 4 AI-assisted audit passes and fixed every finding. Wrote 54 Foundry tests, including invariant and gas tests, plus 117 backend tests. Verified on Monad testnet.

Squadjar - Monad Metropolis Hackathon, Smart Contract Engineer (team of 2) | Live | GitHub Oct 2026

- Wrote the contracts for a rotating savings app (ajo/esusu). A factory deploys one contract per group to hold its funds and pay out each round, with no withdraw function or admin key.
- Designed a payout hold-back based on each member's on-chain trust tier, and debt tracking that sends a missed contribution straight to the member who was short-paid.
- Wrote 70 unit tests and 3 fuzz invariant tests (1,000 random runs each) that check the balance always matches the accounting. Verified on Monad testnet.

ERC721 and ERC20 Contracts Sep 2025

- Wrote and deployed an ERC721 collection on Base with on-chain minting (listed on OpenSea) and an ERC20 token on Ethereum Sepolia, both with Foundry tests and deploy scripts.

EXPERIENCE

Tektradoor - Independent Developer | tektradoor.com 2025 - Present

- Built an automated crypto futures trading engine in Python. AI agents run each trade from entry to exit without manual input.
- Trained XGhost, an XGBoost model that scores every trade setup before the engine places it.

Hsbyfiona - Freelance Full-Stack Engineer (Contract) | hsbyfiona.com Sep 2026 - Present

- Built and launched an online store for a perfume retailer in Nigeria as the only engineer, with card, bank transfer and USSD payments, order tracking and an owner dashboard. It took 30+ orders in its first month.

SKILLS

Solidity • Rust • Foundry • OpenZeppelin • ERC20 • ERC721 • Fuzz and Invariant Testing • EVM • NEAR • TypeScript • Node.js • Next.js • viem • PostgreSQL • Python • Git

EDUCATION

Elizade University, Ondo State, Nigeria - B.Eng. Computer Engineering (CGPA 4.02/5.00) Nov 2020 - Sep 2025

CERTIFICATIONS

- Solidity 101 - Cyfrin Updraft (2025)
- Blockchain Basics - Cyfrin Updraft (2025)
- Python Crash Course - Udemy (2021)
