linkedin.com/in/imisioluwa-obaseki-537298318 | github.com/Haikeysgit

SUMMARY

Full-stack engineer who ships products end to end and builds AI agents, plus the checks that keep them honest: a supervisor that catches coding agents faking green tests, an on-chain spending cap for agents that hold money, and a test rig whose results cannot be tuned after the fact.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL, Rust, Solidity

Backend: Node.js, NestJS, FastAPI, GraphQL, REST APIs, WebSockets, PostgreSQL

Frontend: React, Next.js, Astro, Tailwind CSS

AI & ML: AI agents, agent supervision and rollback, LLM APIs, XGBoost, CatBoost

PROJECTS

Kedge: Verification for AI Coding Agents | team of 2 | neatHack 2026, 14th of 205 projects

- Built in 48 hours. Kedge supervises an unattended AI coding agent fixing failing Dependabot and Renovate PRs, and checks every step for drift: deleted or skipped tests, edits outside the plan, loops, budget overruns and false "all tests pass" claims.
- When it finds drift, it rolls back to the last good commit and retries with a recovery note. On the same PR with the same sabotage, the unsupervised agent shipped 2 of 5 tests and said "Fixed"; under Kedge the PR shipped with 5 of 5.
- Over 10 real failing dependency PRs, it turned 4 of the 9 fixable ones green, unattended. Code: github.com/Haikeysgit/kedge

Stack: Python, TypeScript, OpenCode, neatlogs

Bulkhead: Spending Cap for AI Agents | Smart Contract Engineer, team of 2 | NEAR Hackathon

- Bulkhead is a firewall and contract-enforced spending cap for AI agents that hold money. I wrote the NEAR vault contract in Rust; it controls its Bitcoin and Base USDC through NEAR Chain Signatures, so no person holds a private key.
- Each tier enforces a per-payout cap, a cooldown and a round limit on-chain, so a tricked agent can release only one small fixed amount. Owner actions are two-step proposals and the contract is not upgradeable.
- Built a one-command TypeScript deploy tool; 83 Rust unit tests and 15 TypeScript tests. Bitcoin testnet4 payout signed by the contract: `a8ecea7c06b387f86349322cf025233c3f170e69a2a31f27e274e70ae89e8b1a`

Stack: Rust, near-sdk, NEAR Chain Signatures, Bitcoin, Base, TypeScript, Bun

Tektradoor Trading Engine | Solo Developer *tektradoor.com*

- Architected and built a fully automated crypto futures trading engine in Python, run by AI agents, that manages the complete trade lifecycle with zero manual intervention.
- Engineered a multi-strategy technical analysis stack with structural entry gates (Fair Value Gaps, CRT) layered with XGhost, a proprietary XGBoost model that scores each trade setup before execution.
- Implemented a real-time re-validation engine that re-checks pending orders every 30 seconds and applies a widest-wins stop-loss arbitration strategy across multiple candidates.
- Added a macroeconomic event filter that pauses trading around high-impact news.
- Built a pre-registered test system for new strategies: each one's rules, seed and code version are hashed and timestamped before it runs on out-of-sample data, so results cannot be tuned after the fact.

Stack: Python, FastAPI, PostgreSQL, XGBoost, WebSockets

GafferScore & The Gaffer | Solo build *gafferscore.xyz*

- Built and launched a live Premier League prediction game: users predict results and exact scores and climb a global leaderboard. Auth, automated scoring, email verification with Resend, and fixtures fetched from live sports APIs.
- Built The Gaffer, its AI prediction agent: a bivariate Poisson model on xG data with a CatBoost meta-model, match analysis written through the Groq API, and data pipelines on GitHub Actions. It plays live against the human players.

Stack: TypeScript, Next.js, PostgreSQL, Python, CatBoost, Groq API, GitHub Actions, Vercel

Chog Buddy | Backend & Smart Contract Engineer, team of 2 | Chogathon 2026 *chogbuddy.vercel.app*

- Built the backend for a desktop AI pet for Chog NFT holders that talks in its own voice and writes a private diary of the user's day: chat and diary APIs, wallet sign-in with NFT ownership checks on Monad mainnet, and a daily job that records each pet's activity on-chain.
- Built the settlement API for Focus Bets: self-reported focus can only grow as fast as the clock, and every bet settles exactly once. 117 backend tests and 54 Foundry tests.

Stack: TypeScript, Next.js, viem, PostgreSQL (Neon), Solidity, Vercel

Hsbyfiona E-commerce Platform | Freelance Full-Stack Engineer, solo build *hsbyfiona.com*

- Built and launched the online shop for a perfume seller in Nigeria: search, a Scent Match quiz, guest checkout, delivery to every state (local orders priced by road distance), order tracking and an owner dashboard for orders, dispatch, stock and discount codes.
- Integrated Paystack payments (card, bank transfer, USSD) with a webhook that marks the order paid, emails a PDF receipt and updates stock; tested end to end with real money.

Stack: TypeScript, Astro, React, Tailwind CSS, Convex, Paystack, Resend, Cloudflare Workers

EDUCATION

B.Eng. Computer Engineering | Elizade University *Nov 2020 – Sep 2025*

Ilara-Mokin, Ondo State, Nigeria • CGPA: 4.02 / 5.00

CERTIFICATIONS & OPEN SOURCE

- Cyfrin Updraft: Blockchain Basics (2025), Solidity 101 (2025) • Udemy: Python Crash Course (2021)
- Aden HQ, Hive (AI agent framework): contributed Windows 11 compatibility fixes and onboarding documentation.
