Imisioluwa Faith Obaseki

Full-Stack Engineer | TypeScript, Python, AI Agents

imisioluwa@obaseki.dev | obaseki.dev | linkedin.com/in/imisioluwa-obaseki-537298318 | github.com/Haikeysgit | Nigeria, open to remote

SUMMARY

Full-stack engineer who designs, builds and ships production web apps and AI agent systems end to end in TypeScript, Python and PostgreSQL. Sole engineer on a live e-commerce store with Paystack payments for a freelance client and on a live Premier League prediction platform with its own ML prediction agent. Co-built Kedge, a supervisor that catches AI coding agents faking passing tests (14th of 205 projects, neatHack 2026). B.Eng. Computer Engineering, CGPA 4.02/5.00.

SKILLS

Languages: TypeScript, JavaScript, Python, SQL, Rust, Solidity

Frontend: React, Next.js, Astro, Tailwind CSS

Backend: Node.js, Bun, FastAPI, REST APIs, WebSockets, webhooks, scheduled jobs

Databases: PostgreSQL (Neon), Convex

AI and ML: AI agents, LLM APIs (Groq), agent supervision and rollback, XGBoost, CatBoost, statistical modelling

Cloud and DevOps: Vercel, Cloudflare Workers, GitHub Actions, Git

Integrations: Paystack, Resend, live sports data APIs, viem (EVM)

EXPERIENCE

Freelance Full-Stack Engineer | Hsbyfiona (hsbyfiona.com) **Sep 2026 - Present**

- Built and launched, as sole engineer, a production e-commerce store for a Nigerian perfume retailer, covering product search, a Scent Match recommendation quiz, guest checkout and order tracking.
- Integrated Paystack payments (card, bank transfer, USSD) with a webhook that confirms payment, emails a PDF receipt and updates stock automatically; verified end to end with live payments.
- Implemented nationwide delivery to every Nigerian state, pricing local orders by road distance.
- Built an owner dashboard for orders, dispatch, stock and discount codes, giving the client self-serve control of daily operations.

Stack: TypeScript, Astro, React, Tailwind CSS, Convex, Paystack, Resend, Cloudflare Workers

Independent Developer | Tektradoor (tektradoor.com) **2025 - Present**

- Architected and built an automated crypto futures trading engine in Python, operated by AI agents, that runs the full trade lifecycle with no manual intervention.
- Built XGhost, an XGBoost model that scores each trade setup before execution, on top of a multi-strategy technical analysis stack with structural entry gates (Fair Value Gaps, CRT).
- Implemented a real-time re-validation engine that re-checks pending orders every 30 seconds and arbitrates stop-loss placement across candidates, plus a macroeconomic event filter that pauses trading around high-impact news.
- Designed a pre-registered evaluation system that hashes and timestamps each strategy's rules, seed and code version before out-of-sample testing, so results cannot be tuned after the fact.

Stack: Python, FastAPI, PostgreSQL, XGBoost, WebSockets

Independent Developer | GafferScore (gafferscore.xyz) 2024 - Present

- Built and launched a live Premier League prediction platform where users predict results and exact scores and compete on a global leaderboard, with authentication, email verification, automated scoring and fixtures pulled from live sports APIs.
- Built The Gaffer, an AI prediction agent that competes live against human players, combining a bivariate Poisson model on xG data with a CatBoost meta-model, LLM-written match analysis via the Groq API, and data pipelines scheduled on GitHub Actions.

Stack: TypeScript, Next.js, PostgreSQL, Python, CatBoost, Groq API, GitHub Actions, Vercel

PROJECTS

Kedge: Supervisor for AI Coding Agents | neatHack 2026, 14th of 205 | Team of 2 Oct 2026

- Built in 48 hours a supervisor that watches an unattended AI coding agent fix failing Dependabot and Renovate PRs and flags drift at every step: deleted or skipped tests, edits outside the plan, loops, budget overruns and false "all tests pass" claims.
- Rolls back to the last good commit on drift and retries with a recovery note. In a controlled sabotage test on the same PR, the unsupervised agent shipped 2 of 5 tests and reported "Fixed"; under Kedge it shipped 5 of 5.
- Turned 4 of 9 fixable real failing dependency PRs green with no human input (github.com/Haikeysgit/kedge).

Stack: Python, TypeScript, OpenCode, neatlogs

Chog Buddy | Backend Engineer, Team of 2 | Chogathon 2026 (chogbuddy.vercel.app) Oct 2026

- Built the backend for a desktop AI pet for NFT holders: chat and diary APIs, wallet sign-in with NFT ownership checks on Monad mainnet, and a daily job that records each pet's activity on-chain.
- Built a settlement API for Focus Bets that caps self-reported focus at clock time and settles every bet exactly once; covered by 117 backend tests and 54 Foundry contract tests.

Stack: TypeScript, Next.js, viem, PostgreSQL (Neon), Solidity, Vercel

Bulkhead: Spending Cap for AI Agents | Smart Contract Engineer, Team of 2 | NEAR Hackathon

- Wrote a Rust vault contract on NEAR that limits what an AI agent holding money can pay out, enforcing per-payout caps, cooldowns and round limits on-chain; it controls Bitcoin and Base USDC through NEAR Chain Signatures, so no person holds a private key.
- Built a one-command TypeScript deployment tool and shipped 83 Rust unit tests and 15 TypeScript tests; demonstrated with a contract-signed Bitcoin testnet4 payout.

Stack: Rust, near-sdk, NEAR Chain Signatures, TypeScript, Bun

EDUCATION

B.Eng. Computer Engineering | Elizade University, Ilara-Mokin, Nigeria Nov 2020 - Sep 2025
CGPA: 4.02 / 5.00

CERTIFICATIONS

Cyfrin Updraft: Blockchain Basics (2025), Solidity 101 (2025) | Udemy: Python Crash Course (2021)

OPEN SOURCE

Hive by Aden HQ (AI agent framework): contributed Windows 11 compatibility fixes and onboarding documentation.
