Imisioluwa Faith Obaseki

Smart Contract Engineer | Solidity, Rust, Foundry

imisioluwa@obaseki.dev | obaseki.dev | linkedin.com/in/imisioluwa-obaseki-537298318 | github.com/Haikeysgit | Nigeria, open to remote

SUMMARY

Smart contract engineer who writes and tests contracts that hold user funds, in Solidity (Foundry, OpenZeppelin) and Rust (NEAR), and builds the TypeScript backends that settle against them. Deployed and verified contracts on Base, Monad and Ethereum Sepolia, and shipped a NEAR vault that signs Bitcoin and Base transactions through Chain Signatures. Designs out admin access to user funds and backs every contract with unit, fuzz and invariant tests plus multi-pass security reviews. B.Eng. Computer Engineering, CGPA 4.02/5.00.

SKILLS

Smart Contracts: Solidity, Rust (near-sdk), Foundry (forge, cast, anvil), OpenZeppelin, ERC20, ERC721, EIP-2612 permit, factory contracts, NEAR Chain Signatures

Security and Testing: unit, fuzz and invariant testing, gas-budget tests, security review and remediation, non-upgradeable and no-admin-key design, two-step owner actions

Chains: Ethereum (Sepolia), Base, Monad, NEAR, Bitcoin (testnet4); deployment and source verification

Web3 Backend: TypeScript, Node.js, Bun, Next.js, viem, Sign-In with Ethereum (SIWE), PostgreSQL (Neon), REST APIs, Vercel

Other Languages and Tools: Python, JavaScript, SQL, React, Tailwind CSS, FastAPI, GitHub Actions, Git

SMART CONTRACT PROJECTS

Bulkhead: Spending Cap for AI Agents | Smart Contract Engineer, Team of 2 | NEAR Hackathon

- Wrote the NEAR vault contract in Rust for a firewall that caps what an AI agent holding money can spend; the contract controls Bitcoin and Base USDC through NEAR Chain Signatures, so no person holds a private key.
- Enforced per-payout caps, cooldowns and round limits on-chain per tier, so a compromised agent can release only one small fixed amount; the contract builds each transaction itself (fixed chain, token and calldata), owner actions are two-step proposals, and the contract is not upgradeable.
- Built a one-command TypeScript deployment tool that creates a vault, derives each tier's Bitcoin address and registers the agent; shipped 83 Rust unit tests and 15 TypeScript tests and a contract-signed Bitcoin testnet4 payout.

Stack: Rust, near-sdk, NEAR Chain Signatures, Bitcoin, Base, TypeScript, Bun

Chog Buddy | Smart Contract and Backend Engineer, Team of 2 | Chogathon 2026 **Oct 2026**

- Designed FocusPool, a staking contract where users stake an ERC20 (with EIP-2612 permit) on their own focus; it reserves each bonus at stake time, caps it at 1% of the free pot, and on a lost stake burns 10% and returns 90% to the pot. Every bet settles exactly once.
- Wrote ChogSoul, which stores each NFT's daily activity record by token ID so it transfers with the NFT on sale, and built the backend: SIWE wallet sign-in with NFT ownership checks on Monad mainnet, chat and diary APIs, and the daily on-chain write job.
- Ran 4 AI-assisted security audit passes and a backend security scan and fixed every finding; 54 Foundry tests (including invariant and gas-budget tests) and 117 backend tests. Verified on Monad testnet: FocusPool, ChogSoul.

Stack: Solidity, Foundry, OpenZeppelin, Monad, TypeScript, Next.js, viem, PostgreSQL (Neon), Vercel

Squadjar | Smart Contract Engineer, Team of 2 | Monad Metropolis Hackathon **Oct 2026**

- Wrote the contracts for an on-chain rotating savings protocol (ajo/esusu): an ERC20 token, an on-chain trust registry, and a factory that deploys one contract per group to hold funds and pay out each round, with no withdraw function and no admin key.
- Designed a payout hold-back sized by trust tier, so early collectors leave part of what they still owe in the pool, and debt tracking that routes a late contribution straight to the short-paid member. Set up a background service that calls a permissionless settleRound every minute.
- Wrote 70 unit tests and 3 fuzz invariant tests (1,000 random sequences each) proving the pool balance always matches its accounting and total debt always equals total credit; all 73 pass. SquadFactory verified on Monad testnet.

Stack: Solidity, Foundry, OpenZeppelin, Monad

ERC721 and ERC20 Contracts | Base and Ethereum Sepolia **Sep 2025**

- Wrote an ERC721 contract from scratch with on-chain minting and token metadata for a multi-item collection; live on Base, indexed and tradeable on OpenSea.
- Wrote an ERC20 token with OpenZeppelin, Foundry deploy scripts and tests covering supply, ownership and transfers; deployed on Sepolia.

Stack: Solidity, Foundry, OpenZeppelin

EXPERIENCE

Independent Developer | Tektradoor (tektradoor.com) **2025 - Present**

- Architected an automated crypto futures trading engine in Python, operated by AI agents, that runs the full trade lifecycle with no manual intervention.
- Built XGhost, an XGBoost model that scores each setup before execution, and a re-validation engine that re-checks pending orders every 30 seconds.

Stack: Python, FastAPI, PostgreSQL, XGBoost, WebSockets

Freelance Full-Stack Engineer | Hsbyfiona (hsbyfiona.com) **Sep 2026 - Present**

- Built and launched, as sole engineer, a production e-commerce store for a Nigerian retailer, with Paystack payments (card, bank transfer, USSD), a payment webhook that issues receipts and updates stock, and an owner dashboard; verified end to end with live payments.

Stack: TypeScript, Astro, React, Convex, Paystack, Cloudflare Workers

EDUCATION

B.Eng. Computer Engineering | Elizade University, Ilara-Mokin, Nigeria **Nov 2020 - Sep 2025**
CGPA: 4.02 / 5.00
