SUMMARY

Full-stack software engineer who builds automated systems end to end across backend services, ML, and production frontends. Founder and lead engineer of Tektradoor, a fully automated crypto futures trading engine, and founding engineer of GafferScore, a live Premier League prediction platform. Strong across the TypeScript and Python ecosystems, real-time data pipelines, and blockchain tooling.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, Solidity, SQL

Frontend: React, Next.js, Angular, Tailwind CSS, HTML5, CSS3

Backend: Node.js, NestJS, FastAPI, GraphQL, RESTful APIs, WebSockets

Data & ML: PostgreSQL, Supabase, XGBoost, CatBoost, OCR / Computer Vision

Blockchain: Solana Web3.js, Foundry, OpenZeppelin, ERC20 / ERC721

Tools & Cloud: Vercel, GitHub Actions, Auth0, Git

PROFESSIONAL EXPERIENCE

Founder & Lead Full-Stack Engineer | Tektradoor

2025 - Present

- Architected and built a fully automated crypto futures trading engine in Python that executes trades autonomously on users' Bybit accounts via API, managing the complete trade lifecycle with zero manual intervention.
- Engineered a multi-strategy technical analysis stack with structural entry gates (Fair Value Gaps, CRT) layered with XGhost, a proprietary XGBoost model that scores each trade setup before execution.
- Implemented a real-time re-validation engine that re-checks pending orders every 30 seconds and applies a widest-wins stop-loss arbitration strategy across multiple candidates.
- Added a macroeconomic event filter that pauses trading around high-impact news, and built the product surface (waitlist site, API key management, user dashboards) while leading a 6-person team toward an October 2026 launch.

Stack: Python, FastAPI, PostgreSQL, XGBoost, Bybit API, WebSockets

Founding Full-Stack Engineer | GafferScore

2024 - Present

- Built and launched a live Premier League prediction platform where users compete on a global leaderboard by predicting match outcomes.
- Developed secure user authentication, automated scoring, and a custom email verification system using Resend, with live sports APIs auto-fetching fixtures.
- Built The Gaffer, an AI prediction agent using a bivariate Poisson model with xG data and a CatBoost meta-model (analysis via the Groq API), with data pipelines automated through GitHub Actions and deployed on Vercel with a custom domain.

Stack: TypeScript, Next.js, Supabase, Resend, Vercel, Python

PROJECTS

Flux: Solana Rent Recovery Engine

Hackathon Project

- Blockchain tool deployed on Solana Devnet that scans wallet transaction history to identify idle accounts and recover locked SOL from rent fees.
- Built a real-time dashboard for wallet analysis and automated fund reclamation, demonstrating practical Web3.js integration and on-chain data processing.

Stack: Next.js 16, React 19, TypeScript, Tailwind CSS, Solana Web3.js, Prisma, SQLite

EDUCATION

B.Eng. Computer Engineering | Elizade University

Nov 2020 - Sep 2025 | Ilara-Mokin, Ondo State, Nigeria | CGPA: 4.02 / 5.00

CERTIFICATIONS

- Cyfrin Updraft: Blockchain Basics (2025), Solidity 101 (2025)
- Udemy: Python Crash Course (2021)

OPEN SOURCE CONTRIBUTIONS

Aden HQ - Hive (AI Agent Framework): contributed Windows 11 compatibility fixes and onboarding documentation.
